PROFESSIONAL PROFILE

Developer with solid experience in back-end and front-end technologies, specialized in the development of RESTful APIs. Proven experience in system optimization, service integration and continuous improvement. Proficient in the use of technologies such as NodeJS, ReactJS, and relational (MySQL, PostgreSQL) and non-relational (MongoDB) databases. Proactive and with a strong capacity for teamwork, focused on delivering high-quality solutions that generate tangible results. Seeking new opportunities to apply and expand my skills in web development, contributing to the success of challenging projects.

TECH SKILLS

TypeScript · Node.js · PostgreSQL · MySQL · MongoDB · Redis · React.js · HTML · CSS · Docker · Docker Compose · Git · GitHub · Swagger · Clean Architecture · Clean Code · Supabase · AWS

PROFESSIONAL EXPERIENCE

HeadTech Sistemas

06/2026 - present

Software Engineer

- Orchestrated **AI agents for development (Claude Code)** in the implementation of features based on technical plans that I broke down and specified, performing thorough code reviews and ensuring that every delivery was developed with **Test-Driven Development (TDD)**.
- Integrated AI-assisted development into the engineering workflow, from requirements gathering and technical planning through implementation and validation in CI/CD, **reducing delivery time** without compromising code quality or test coverage.
- **Reduced approximately 70% of staging infrastructure costs (from about US$ 66/month to US$ 19/month)** through a root cause analysis of an oversized database, avoiding simply downsizing the infrastructure as the solution.
- Identified that **98% of the database size** was caused by a log table with no retention policy. Then, led the migration of PostgreSQL to a plan compatible with the application's actual needs, validating data integrity throughout the entire process.
- Developed an **automated log retention process in Python** using Test-Driven Development (TDD) and integrated it into the CI/CD pipeline (GitHub Actions → Heroku), eliminating the root cause of the problem and preventing its recurrence.

Federal Institute of Mato Grosso do Sul

07/2025 - 06/2026

Substitute Teacher - Development

- Worked as a substitute teacher in the area of **Web Development**, teaching high school classes, with a focus on practical training in programming and web application development.
- Planned and conducted theoretical and practical classes for **1st year** classes, covering HTML, CSS, JavaScript and GitHub, providing students with a solid foundation in programming logic, code versioning and web page structuring.
- Taught **2nd year** classes, deepening knowledge in HTML, CSS, JavaScript, TypeScript, PostgreSQL and GitHub, promoting the students' progression toward more structured, typed development with data persistence, increasing their autonomy in creating complete projects.
- Worked with **3rd year** classes, teaching React, PostgreSQL, NestJS and GitHub, guiding students in the development of full stack applications, integrating frontend and backend and raising the technical level and complexity of the projects developed.

- Contributed to the adoption of good development practices, such as code organization, versioning and standardization, resulting in continuous improvement in the technical quality and maturity of the students' projects throughout the school year.

4C Foresee

08/2025 - 12/2025

Full Stack Developer

- Hired under a fixed-term contract to accelerate the initial development phase of a multi-agent customer service SaaS platform. The contract was concluded as planned after fulfilling the defined scope and delivery milestones.
- Contributed to the architecture and development of a **multi-agent customer service SaaS platform for WhatsApp**, still in pre-launch phase, participating in strategic architectural decisions and in the definition of good development practices since its conception.
- Migrated file storage from the local file system to **Amazon S3**, ensuring greater reliability, availability and accessibility of uploaded content across all environments.
- Implemented **Redis** as a caching layer in the infrastructure to optimize high-read operations, reducing the load on the database and increasing the platform's stability before the public launch.
- Acted as a **technical reference** on the team in decisions related to tool selection, integration patterns and architectural trade-offs, in addition to documenting important technical decisions to ensure the long-term maintenance and evolution of the platform.

Zukt Labs

08/2024 - 07/2025

Back End Developer

- Developed and evolved backend systems using **NestJS, Prisma and PostgreSQL** on a platform with approximately 100 users, delivering new features and promoting continuous refactoring to ensure code maintainability and evolution.
- Identified and fixed recurring architectural bottlenecks in production, increasing system stability and reliability **without downtime or service interruption**.
- Took **full responsibility for the production deployment process**, structuring safe, consistent and reproducible delivery pipelines for all environments (CI/CD).
- Designed and implemented a file upload architecture using **Cloudflare R2**, completely decoupling file storage from the application servers and increasing scalability, availability and portability across environments.
- Developed and maintained backend services using **AdonisJS**, delivering features oriented to business needs with a focus on domain clarity and expressive code.
- **Led a structural refactoring initiative** based on Clean Architecture principles, reducing coupling between modules, making changes safer and decreasing the onboarding time of new developers.

ArloesiTech

05/2023 - 08/2024

Full Stack Developer

- Maintained and evolved a legacy system in **Node.js (Express)** used by **approximately 400 active users**, improving its stability, security and maintainability, in addition to systematically reducing technical debt in critical flows.
- Integrated **payment gateways** into existing checkout flows, providing more reliable and secure transaction processing, increasing users' trust in the platform.
- Optimized **MongoDB** queries on highly complex, high-data-volume endpoints, achieving significant gains in response time and memory consumption efficiency for a base of 300 to 500 users.
- Designed and developed **RESTful APIs using NestJS**, applying modular architecture and clear separation of responsibilities to favor scalability and independent evolution of features.
- Ensured data consistency and high performance using **Prisma ORM and PostgreSQL** in transactional and high-load scenarios.
- Implemented caching strategies with **Redis** for frequently accessed data, reducing unnecessary database queries and improving the application's perceived performance.
- Contributed to the development of an **ERP system**, working on both the backend (NestJS) and the frontend (React), delivering complete, production-ready features.
- Promoted alignment between backend and frontend development workflows, reducing integration friction, minimizing rework and making the delivery of new features more efficient.
